Contents:

Parallel testing of IP addresses and domains in python. Reads IP addresses and domains from a CSV file and gives two lists of accessible and inaccessible ones.

## 1.1 About

- Compatible with both Python 2 and 3.
- Testing of IPs and domains is done in parallel.
- By default there are 4 Workers.
- All Workers work on an input Queue and a output Queue.

## 1.2 Modes

- verbose - if true, ping output will be displayed.
- output - json or csv

## 1.3 Support

- Windows, Linux and macOS are supported.
- Supports both IPv4 and IPv6 IPs, and domain names.

```
# Examples
127.0.0.1
::1
localhost
```

## 1.4 Install

```
$ pip install ippyy
```

## 1.5 Usage

```
# Create IPpy instance
ippyy_obj = ippyy.Ippyy()

# Set config - verbose, output, num_workers
# verbose - True or False
# output - csv or json
ippyy_obj.set_config(True, 'csv', 4)

# Set Input File
ippyy_obj.set_file(file='ip_list.csv')

# Run IPpy
ippyy_obj.run()

# Get Results
output = ippyy_obj.result()
print(output)
```

## 1.6 Tests

To run the tests, first install tox

```
$ pip install tox
```

then run tox from the project root directory.

```
$ tox
```

### 2.1 Stable release

To install IPpy, run this command in your terminal:

```
$ pip install ippy
```

This is the preferred method to install IPpy, as it will always install the most recent stable release.

If you don't have [pip](#) installed, this [Python installation guide](#) can guide you through the process.

### 2.2 From sources

The sources for IPpy can be downloaded from the [Github repo](#).

You can either clone the public repository:

```
$ git clone git://github.com/shivammathur/ippy
```

Or download the [tarball](#):

```
$ curl -OL https://github.com/shivammathur/ippy/tarball/master
```

Once you have a copy of the source, you can install it with:

```
$ python setup.py install
```

## CHAPTER 3

---

### Usage

---

To use IPpy in a project:

```
import ippy
```

Contributions are welcome, and they are greatly appreciated! Every little bit helps, and credit will always be given. You can contribute in many ways:

## 4.1 Types of Contributions

### 4.1.1 Report Bugs

Report bugs at <https://github.com/shivammathur/ippy/issues>.

If you are reporting a bug, please include:

- Your operating system name and version.
- Any details about your local setup that might be helpful in troubleshooting.
- Detailed steps to reproduce the bug.

### 4.1.2 Fix Bugs

Look through the GitHub issues for bugs. Anything tagged with “bug” and “help wanted” is open to whoever wants to implement it.

### 4.1.3 Implement Features

Look through the GitHub issues for features. Anything tagged with “enhancement” and “help wanted” is open to whoever wants to implement it.

### 4.1.4 Write Documentation

IPpy could always use more documentation, whether as part of the official IPpy docs, in docstrings, or even on the web in blog posts, articles, and such.

### 4.1.5 Submit Feedback

The best way to send feedback is to file an issue at <https://github.com/shivammathur/ippy/issues>.

If you are proposing a feature:

- Explain in detail how it would work.
- Keep the scope as narrow as possible, to make it easier to implement.
- Remember that this is a volunteer-driven project, and that contributions are welcome :)

## 4.2 Get Started!

Ready to contribute? Here's how to set up *ippy* for local development.

1. Fork the *ippy* repo on GitHub.
2. Clone your fork locally:

```
$ git clone git@github.com:your_name_here/ippy.git
```

3. Install your local copy into a virtualenv. Assuming you have virtualenvwrapper installed, this is how you set up your fork for local development:

```
$ mkvirtualenv ippy
$ cd ippy/
$ python setup.py develop
```

4. Create a branch for local development:

```
$ git checkout -b name-of-your-bugfix-or-feature
```

Now you can make your changes locally.

5. When you're done making changes, check that your changes pass the tests, including testing other Python versions with tox:

```
$ python setup.py test or py.test
$ tox
```

To get tox, just pip install them into your virtualenv.

6. Commit your changes and push your branch to GitHub:

```
$ git add .
$ git commit -m "Your detailed description of your changes."
$ git push origin name-of-your-bugfix-or-feature
```

7. Submit a pull request through the GitHub website.

## 4.3 Pull Request Guidelines

Before you submit a pull request, check that it meets these guidelines:

1. The pull request should include tests.
2. If the pull request adds functionality, the docs should be updated. Put your new functionality into a function with a docstring, and add the feature to the list in README.rst.
3. The pull request should work for Python 2.6, 2.7, 3.3, 3.4 and 3.5, and for PyPy. Check [https://travis-ci.org/shivammathur/ippy/pull\\_requests](https://travis-ci.org/shivammathur/ippy/pull_requests) and make sure that the tests pass for all supported Python versions.

## 4.4 Tips

To run a subset of tests:

```
$ py.test tests.test_ippy
```

## CHAPTER 5

---

### Indices and tables

---

- `genindex`
- `modindex`
- `search`
